EXPERIMENT NO.:10

Date of Performance:

Date of Submission:

Aim: Version control of the project

Software Used: GitHub

Theory:-

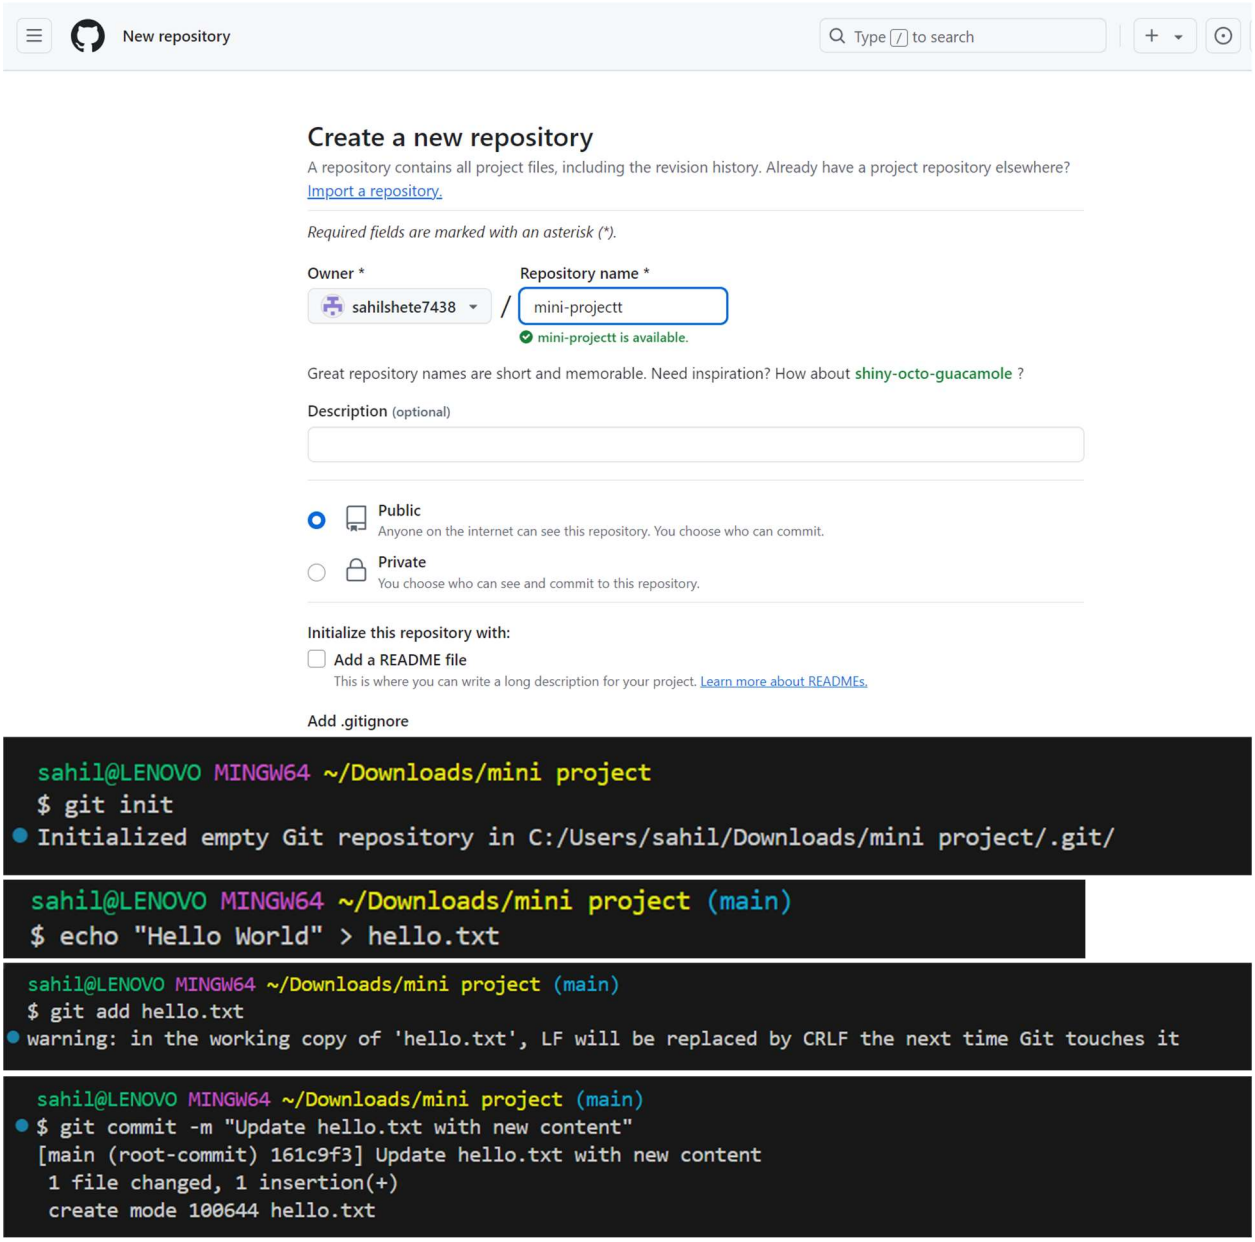
Version control systems are a category of software tools that helps in recording changes made to files by keeping a track of modifications done to the code.

As we know that a software product is developed in collaboration by a group of developers they might be located at different locations and each one of them contributes in some specific kind of functionality/features. So in order to contribute to the product, they made modifications in the source code(either by adding or removing). A version control system is a kind of software that helps the developer team to efficiently communicate and manage (track) all the changes that have been made to the source code along with the information like who made and what change has been made. A separate branch is created for every contributor who made the changes and the changes aren't merged into the original source code unless all are analyzed as soon as the changes are green signaled they merged to the main source code. It not only keeps source code organized but also improves productivity by making the development process smooth.

Benefits of the version control system:
a) Enhances the project development speed by providing efficient collaboration,
b) Leverages the productivity, expedite product delivery, and skills of the employees through better communication and assistance,
c) Reduce possibilities of errors and conflicts meanwhile project development through traceability to every small change,
d) Employees or contributor of the project can contribute from anywhere irrespective of the different geographical locations through this **VCS,**
e) For each different contributor of the project a different working copy is maintained and not merged to the main file unless the working copy is validated. A most popular example is **Git, Helix core, Microsoft TFS,**
f) Helps in recovery in case of any disaster or contingent situation,
g) Informs us about Who, What, When, Why changes have been made.

Use of Version Control System:

- **A repository:** It can be thought of as a database of changes. It contains all the edits and historical versions (snapshots) of the project.
- **Copy of Work (sometimes called as checkout):** It is the personal copy of all the files in a project. You can edit to this copy, without affecting the work of others and you can finally commit your changes to a repository when you are done making your changes.



```
sahil@LENOVO MINGW64 ~/Downloads/mini project
$ git init
Initialized empty Git repository in C:/Users/sahil/Downloads/mini project/.git/
```

```
sahil@LENOVO MINGW64 ~/Downloads/mini project (main)
$ echo "Hello World" > hello.txt
```

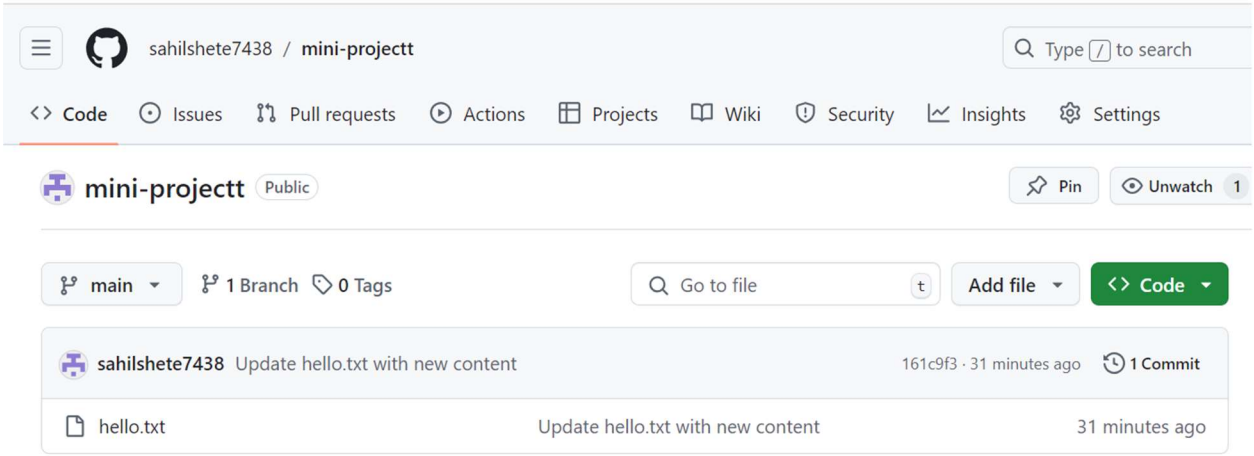
```
sahil@LENOVO MINGW64 ~/Downloads/mini project (main)
$ git add hello.txt
warning: in the working copy of 'hello.txt', LF will be replaced by CRLF the next time Git touches it
```

```
sahil@LENOVO MINGW64 ~/Downloads/mini project (main)
$ git commit -m "Update hello.txt with new content"
[main (root-commit) 161c9f3] Update hello.txt with new content
 1 file changed, 1 insertion(+)
 create mode 100644 hello.txt
```

```
sahil@LENOVO MINGW64 ~/Downloads/mini project (main)
$ git remote -v

sahil@LENOVO MINGW64 ~/Downloads/mini project (main)
$ git remote add origin https://github.com/sahilshete7438/mini-projectt

sahil@LENOVO MINGW64 ~/Downloads/mini project (main)
$ git push -u origin main
Enumerating objects: 3, done.
Counting objects: 100% (3/3), done.
Writing objects: 100% (3/3), 241 bytes | 241.00 KiB/s, done.
Total 3 (delta 0), reused 0 (delta 0), pack-reused 0 (from 0)
To https://github.com/sahilshete7438/mini-projectt
 * [new branch]      main -> main
branch 'main' set up to track 'origin/main'.
```



Conclusion: Here We know Version control of the project
